Galvanized rectangular steel will give years of strong, maintenance free service

Peaked roof design & slippery cover creates maximum snow shedding capacity

Simple design with comprehensive installation guide means quick installation time

Custom profile & spacing for specific height & strength requirements, unique for you!

STEPS TO YOUR SHELTER CUSTOMIZATION

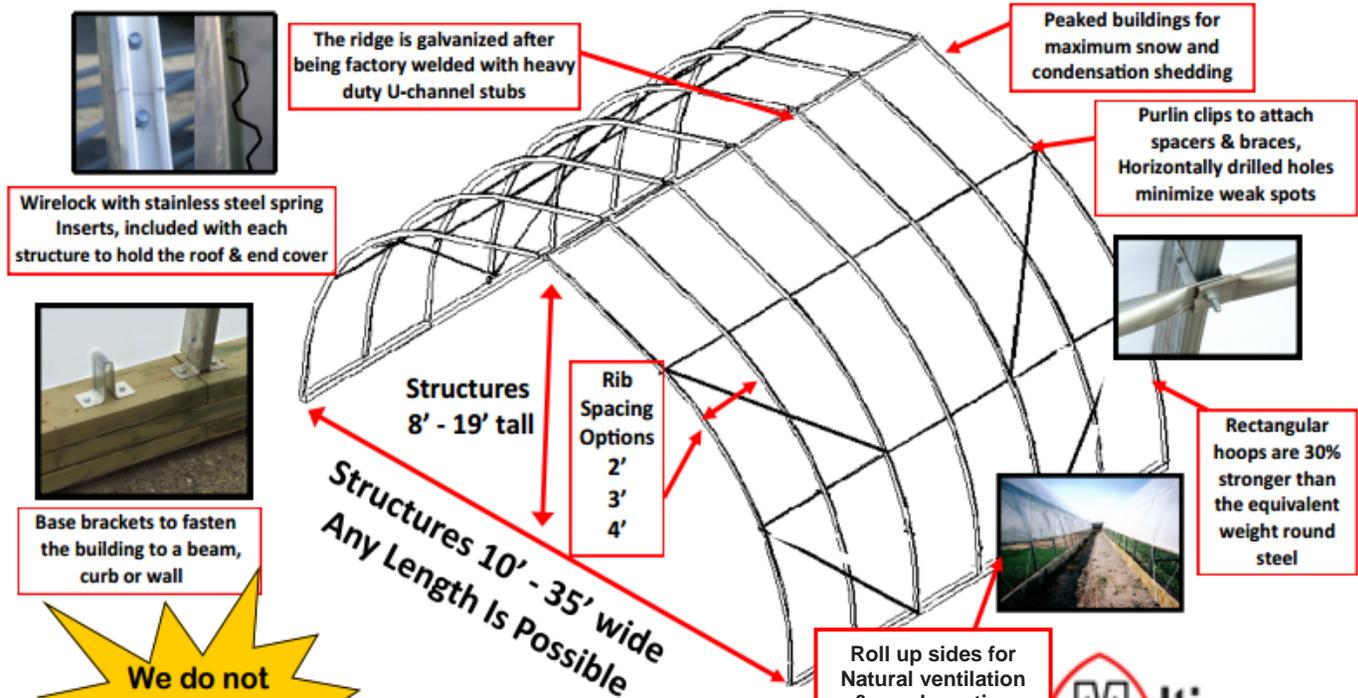

- 1. Pick a Location:** Your building must be level from side to side. If you can't excavate we can design a variation. End to end slope is ok but if it is more than 1%, we need to know. If you are butting against a building, there may need to be some extra hoops in the first 12' of length. Building behind something does not provide shelter. You actually increase wind turbulence.
- 2. Pick a width:** Most of our standard widths can easily be modified if it needs to be specific. The widest we do with engineered drawings is 30' but have supplied up to 36' wide.
- 3. Pick a length:** Any length is possible; simply by adding hoops. If you are building between 2 fixed points, the last hoop spacing can be modified to fit the spot.
- 4. Pick a height:** We have 7 lengths of steel to pick from and do not bend anything until we get an order. Building higher will improve the snow shedding characteristics of the building. Building higher gives more interior space close to the wall but the structure catches more wind. Since building higher catches more wind, the structure may require reduced hoop spacing. Building higher will be a little more costly to heat but does improve natural air circulation. Building lower will decrease snow shedding and may require closer hoop spacing.
- 5. Pick a base or foundation:** The standard package comes with a bracket under each hoop to secure the building to a beam. This beam can be ground mounted or on blocks, posts, slab or shipping containers. We can supply a welded steel base rail if the structure needs to be moveable. We can supply anchor posts. Each hoop would sit on a post that may need to be set into concrete. **Please remember that there simply is no such thing as too many anchors.**
- 6. Pick a cover:** The standard covers we offer are 12 mil tarp (white or green) and 6mil (white or clear). White tarp has a typical 8-10-year life and gives summer shade and winter light. Green tarp has a typical 6-7-year life and is hotter in summer and colder in winter. 6mil clear plastic must be used for plants. Typical life span is 5-6 years. 6mil white plastic is used where shade is important but still need light. Typical life is 4-6 years. Doubling up on plastic reduces heat loss by 30%, minimizes condensation and increases life span by 50%.
- 7. Determine ventilation:** Roll up sides are an economical add on to our greenhouses or livestock shelters to provide natural ventilation. Roof vents and exhaust fans are available options.
- 8. Building ends:** Our package prices include covers for both ends. The assembly guide gives pointers on framing ends. We can supply steel frame ends, with or without a variety of sizes and types of doors.

Gothic/Regular High Profile Cathedral Space Saver Hanley Tunnel

40 Years of Creativity & Experience Behind Every Structure

As Canadian Weather becomes more unpredictable, our shelters get upgraded to stand the test!

We do not bend anything before we get an order!

Specific numbers for profile heights are on our brochures and on our web site. Some minor additional upgrades may be required by local building requirements.

5 Covers to Choose From			
Material	Colour	Thickness	Lifespan
Tarp	White	12 mil	9-10 yrs*
Tarp	Green	12 mil	6-7 yrs*
